LTB Sales Portal - System Development Progress

Fourth Milestone

Currently, 85% of the goals set for this milestone have been achieved. Even though most of the data issues have been solved, the delay caused by gathering and analyzing new data sources contributed to the 15% lag experienced in Milestone III. Also, the lag in the interface development contributed to a delay in some of the controllers of this project. This is because functions of objects such as ProFormas, Programs, and Collections are directly associated to events that are caused by actions performed by a user. Therefore, the development and implementation of these controllers should be done during the same stage. *Note: the lag in the interface development is due to reasonable factors that can be disclosed by True Interaction, per request, at any time.* Overall, all models, controllers and GUI (Graphical User Interface) for objects of high priority have been developed and implemented. Objects that are missing its GUI and implementation, such as log, will be developed and implemented during the evaluation stage of this.

Milestone Goals:

The goals of this milestone were based on further analyzing the data, including new data sources, and implementing the models, GUI, and operation methods of the system.

1. The data analysis task was based on identifying the missing data sources, gathering and handling data, and detecting and correcting corrupt or inaccurate data from the provided data sources. A proper data preparation and cleaning cannot be performed until all necessary data is gathered.

a. Data Preparation
b. Data Evaluation

2. The second task is the implementation of both system models, the user-based and the strategy-plan. In order to achieve the main goal of the project, which is the implementation of the sales process logic, it was necessary to prioritize the features of the system based on their importance level. The objects with highest priority were the following:

a. User-Based Model:
   i. Driver
   ii. Customer

b. Strategy-Plan Mode:
   i. Agreement
   ii. ProForma
   iii. Demand Solution
   iv. Item

The objects above were given higher priority in order to build a state machine that can be tested and improved while completing other tasks pertaining to low priority objects. The state machine contains the logic of the current sales process being utilized at LTB, however, this is being implemented in an automatic and more efficient manner. Note that tasks with low priority are tasks with a low complexity level and, or, a very small impact, or none, to the main system.

Project Progress:

A brief summary of the work done to achieve the goals mentioned above is being described below, to obtain a more descriptive information above the current state of the project you can access the files provided in the reference section of this report.

1. The complexity and uncertainty of the data has been somewhat challenging and complex to cover in this report. Nevertheless, you can have access to the latest identified and provided data sources through this link data handling. Also, you can have access to the latest datasets provided through this link Cliff Artifacts. Lastly, to keep up with some of the tests and validations that are currently being performed on the data, you can access the following link data analysis.

2. This report provides a brief description of all objects with high priority and also for some of those with low priority due to the amount of content. The detailed progress will be split into the User-Based Model and the Strategy-Plan Model sections, and the Low-Priority Objects section will summarize the progress of low priority objects.

User-Based Model (Controllers): these controllers allow users to manage other users such as customers and employees.

a) Driver

Admin::DriversController
create delete edit index new search show update
_layout driver_params driver_search_params

This controller allows users to create, edit and delete drivers. It also allows them to search, filter, and view drivers. Drivers are also searchable within an Agreement.

b) Customer

Admin::CustomersController
index search show
_layout customer_search_params

This controller allows users to to search and view customers. Access to the controller "customer_search_params" allows users to filter customers accordingly.

b) Groups & Permissions

Admin::UsersController
add_admin index remove_admin search update
_layout

This controller allows admin users to add, update and remove other users. And, all users are able to search other users.

Strategy-Plan Model(Controllers): these controllers allow users to manage sales orders, performance and events accordingly.

a) Agreement

AgreementsController
add_division add_driver add_items create index new remove_column remove_driver search set_field show update
_layout agreement_field_params agreement_params agreement_search_params setup_form

This controller allows users to create, edit agreements. Also, it allows users to add divisions and items and designate drivers to these individually or globally. Access to other agreement controllers, shown to the left, allows users to search, filter and view agreements in the Agreement index page.

b) ProForma

ProformasController
add_collections add_items create dock index new remove_items search show update
_layout proforma_params proforma_search_params

This controller allows users to create, edit, search and view ProFormas. Also, it allows users to filter, add and remove items and collections.

c) Demand Solution

DemandsController
details index search update_filters
_layout search_params

This controller allows users to search, filter and view sales history based on customers and profit centers(divisions).

d) Item

ItemsController
availability details dock index search update_filters
_layout search_params

This controller allows users to search, filter and view Items in the Item index page.

True Interaction

Low-Priority Objects

a) Collection

CollectionsController

add_items
create
dock
index
new
remove_items
search
show
update

_layout
collection_params
collection_search_params

When creating a Collection object this controller allows users to add and remove items. Similarly, it allows users to search, filter and view Collections.

b) Shipment

ShipmentsController

add_collections
add_items
create
dock
index
new
remove_items
search
show
update

_layout
shipment_params
shipment_search_params

This controller allows users to add and remove collections and items from a shipment object. Also, it allows users to search, filter, and view shipments from its index page.

c) Scheduling

EventsController

add_items
create
dock
index
new
remove_items
search
show
update

_layout
event_params
event_search_params

This controller allows users to create, edit, and delete events. Also, it allows users to search, filter and view events in the scheduling index page.

d) Log

The log controller uses other controllers to access objects status and updates.

e) Settings

- Group & Permissions

Admin::GroupsController

add_users
create
delete
edit
new
remove_users
show
update

_layout
group_params

This controller allows users to create, delete and edit groups. Also, it allows users to add users to groups for permissions assignments.

- Special Handling

Admin::SpecialHandlingsController

create
delete
edit
index
new
search
show
update

_layout
special_handling_params
special_handling_search_params

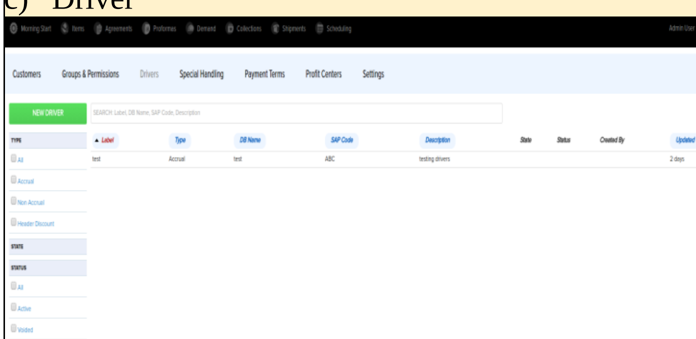
A controller used to add special conditions to a program for a ProForma during a sales process.

- Other Settings

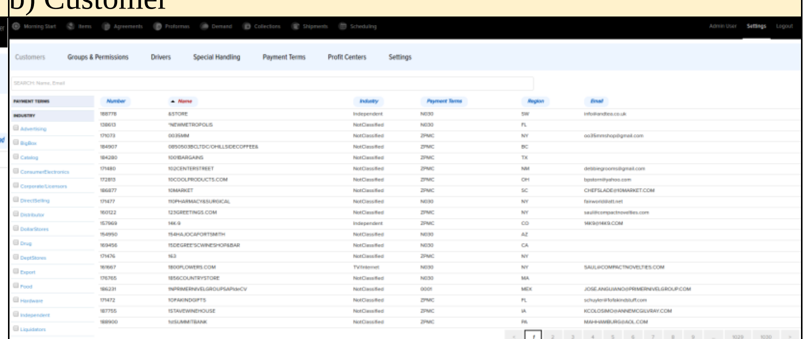
There are other controllers that allow users to handle Payment Terms, Profit Centers, among others.

User-Based Model (View): the controllers below allow users to manage other users such as customers and employees

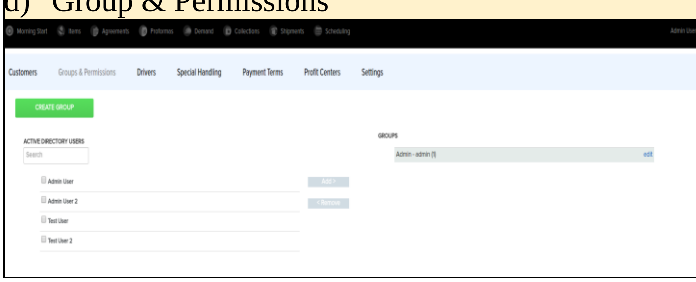
c) Driver



b) Customer



d) Group & Permissions



These are some of the object's views built for the User-Based model of this application. Currently, users are able to create, edit and save drivers (c). Users can search and filter Customers (b), whom can get drivers assigned through an Agreement. Also, users can be created and assigned to a group (d) – which can also be created. These and most objects within this model can be searched, filtered and viewed accordingly.

Documented by:
Piter Garcia

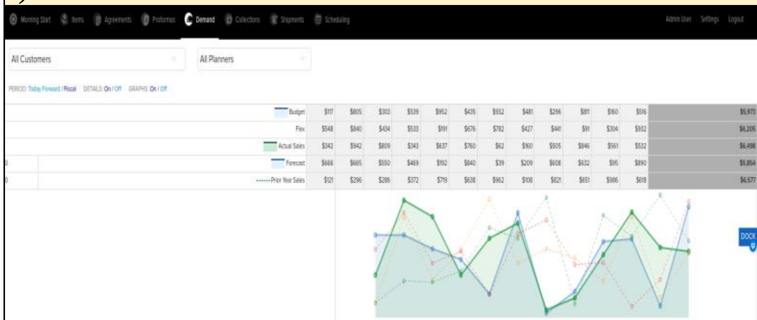
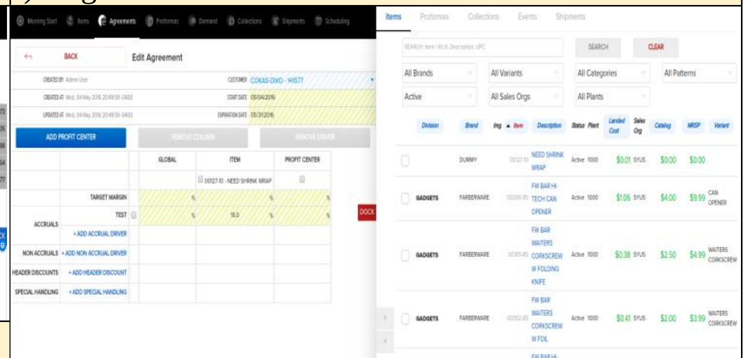
True Interaction

Strategy-Plan Model(View): these controllers allow users to manage sales orders, performance and events accordingly.

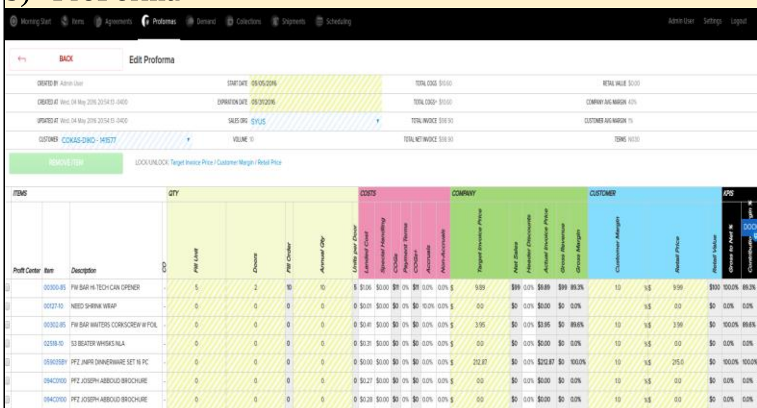
c) Demand Solution



a) Agreement

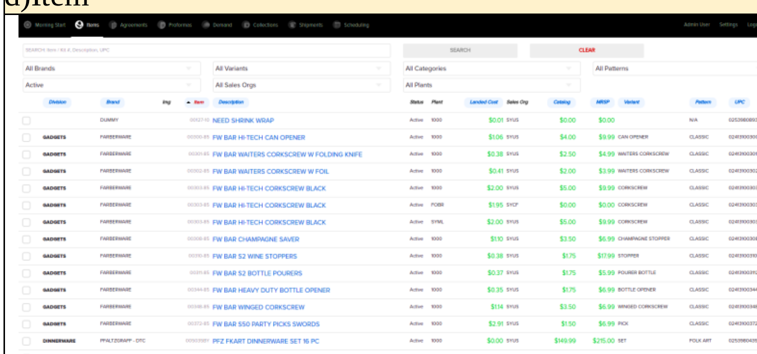


b) ProForma

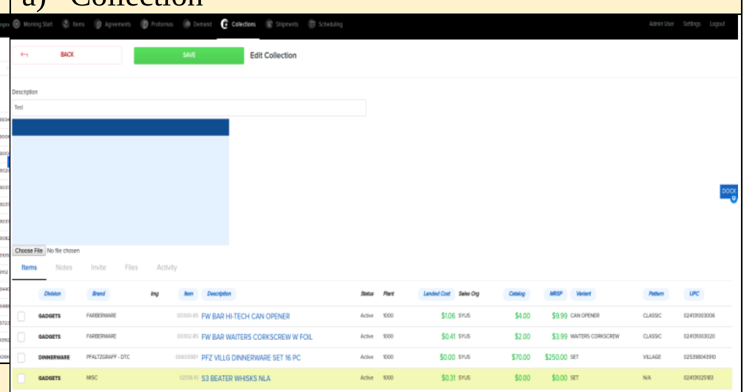


Objects from a - c have highest priority, their view was built and implemented as shown in their images. Currently, users are able to create an Agreement object (b), add division(s) and/or item(s) to this, and assign their drivers either globally or individually. All saved drivers can be used during the construction of an Agreement (b) towards a division items or item(s) pricing. Also, they can create a ProForma (b) and utilize all Agreements linked to the items added within this ProForma (b). Then, it performs the company/ customer margins, among other calculations.

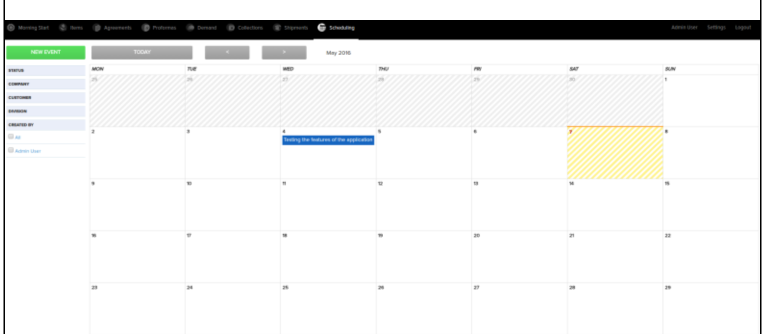
d)Item



a) Collection



c) Scheduling

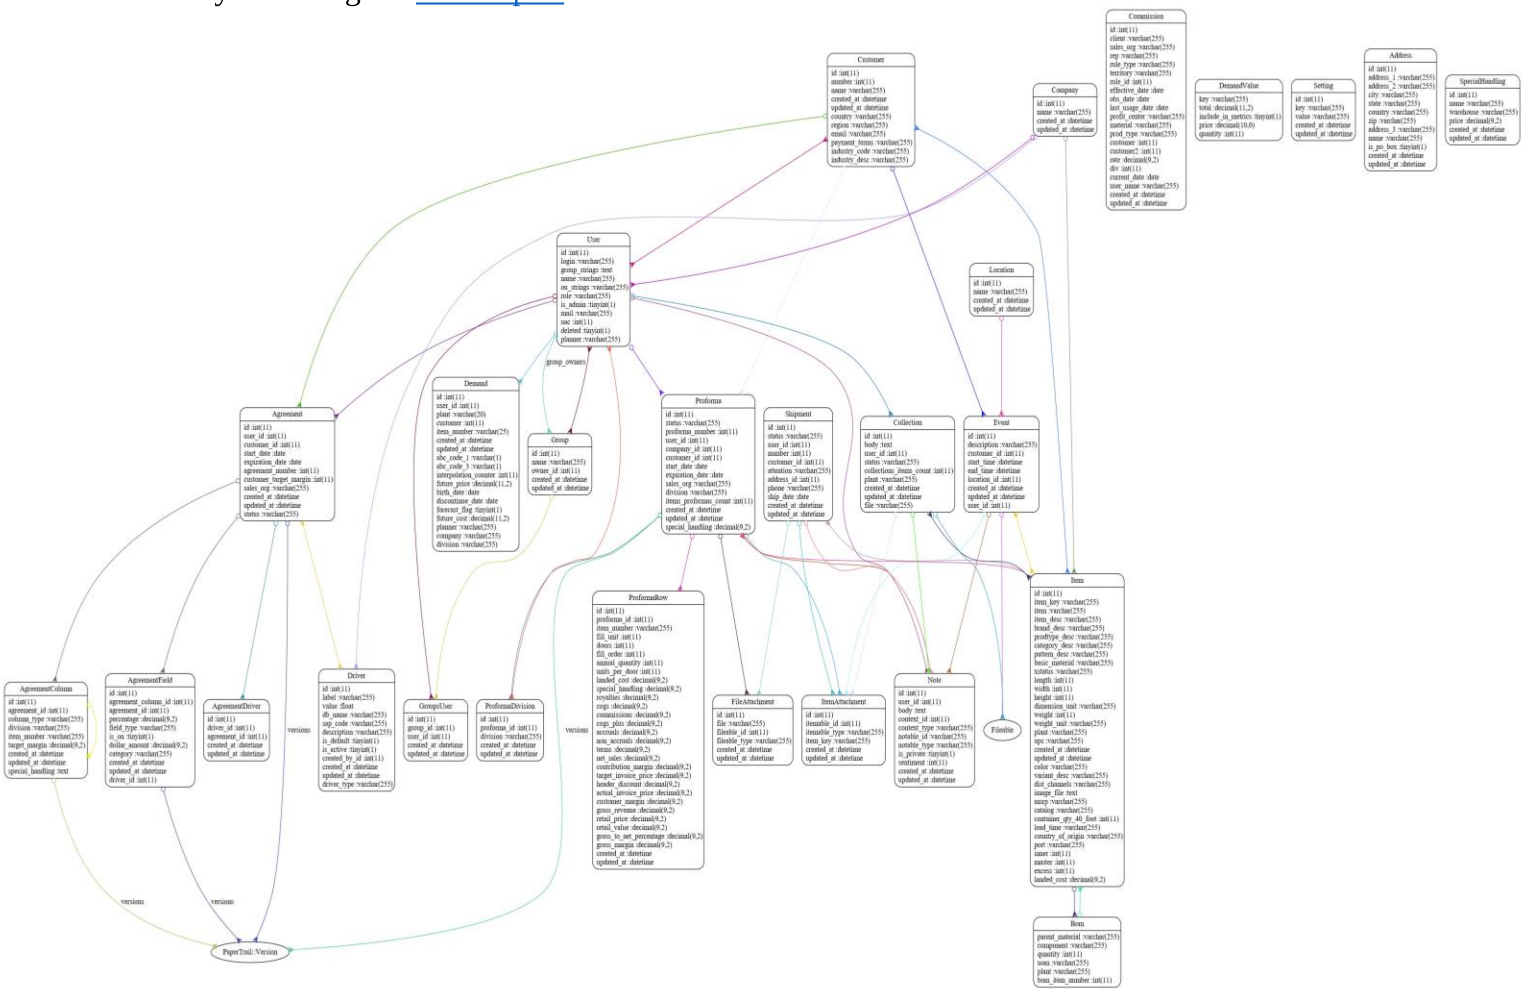


In Demand Solution(c), users can search for customers' /divisions sales history and observe their performance based on their past, current and expected sales. Objects with highest priority (a-c) depend on Items (d), which makes Item a very important object. Currently, users can search, filter and view Items everywhere through a dock. Also, Items (d) can be added to Agreements (a), ProForma (b), Collections (a′) and Scheduling (c′) objects. Collections and Scheduling(Event) objects can also be created, edited and saved.

Documented by: **On behalf of:**
Piter Garcia True Interaction

As illustrated above the implementation of the user-based and the strategy-plan system models have been successfully done. The strategy-plan system contains the "Operation Methods" - these are all methods utilized by sales group, which are also accessible by the finance group. This integration is the overall result of the "Life Time Brand(LTB) Sales Portal" system model implementation, which is being illustrated below.

Note: the current diagram of the system model development is subject to changes, especially now that the system is in its evaluation stage -which is the last stage of this project. Changes to the current system implementation can be monitored by accessing the [ERD report].



Next Step:

The next step is the System Evaluation stage of the application features that have been developed and implemented to meet the client's needs. This step will consist of 1) individually evaluating all methods and identify possible issues, 2) debug identified issues and improve system, 3) deploy a system prototype and allow customer to test all application features.
