

PERMISSIONS BASED SYSTEM

This model is to provide users with permissions on four different layers of the system such as Group/User, Item, Finance and Operations. Each user will be directly associated to a group, which will grant users access to functions that have been assigned to this group by a super user. The SUPER USER is the parent class that contains most functions of the system. A super user can create groups and users with either basic or full permissions, where a user with full permissions could act as a super user if this has permissions for Group/User, Finance, Item and Operations.

All functions in the parent class are automatically inherited by users, whom can access these functions based on the permissions of their group. An USER class can represent an employee, such as a Sales or Finance Person, Customer, Owner, among others. Similarly, a GROUP object is used to represent a group of users, such as a Sales or Finance Department, Company, Customers group, and so on. Lastly, users with special permissions, such as division heads, are added to a special group that will provide them with the higher permissions. The goal of this model is to provide the company with the flexibility to grant their employees access to as many functions as possible according to their capabilities. In this manner, the system becomes more productive because is both top down and bottom up; where upper and middle levels management can work together to finalize a plan.

GROUP/USER	Objects utilized to reference companies and groups, and employees, customer and owners.
FINANCE	Provide permissions to a set of budgets that identify sources of funds for the planned operation and the uses for these funds during a period to carry out the budget activities.
OPERATIONS	Provide permissions to needed resources and the way that these resources will be acquired for all day-to-day activities such as sales and services, production, purchasing, marketing, and research and development.
ITEM	Provide permissions to items and their basic information as well as their history and performance.
PERMISSIONS	Object utilized to privatize all functions in SUPER USER, the parent class, and provide users with permissions to access all, or some, of these functions according to the group they belong to.

GROUPS/USERS SETTINGS

A. GROUPS:

1. Create Group:

- Info Settings:
- Other Settings:
- Permissions
- Users:

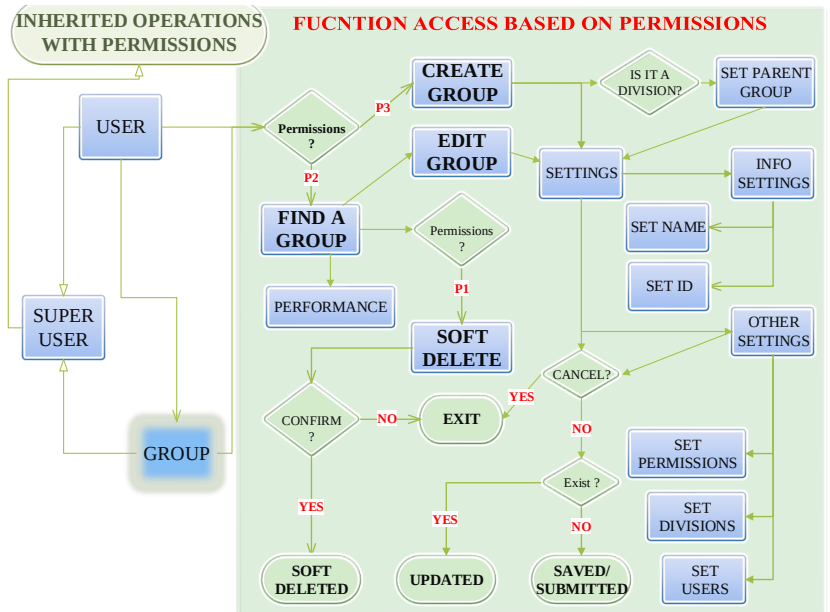

2. Find Group:

- Edit:
- Soft Delete:

3. Performance

- Items
- Margin

Settings for Groups

B. USERS

1. Create User:

- Info Settings:
- Other Settings:
